

HOW OIL AND GAS OPERATIONS IMPACT YOUR BABY'S HEALTH

Air pollutants associated with oil and gas operations are known to cause serious health impacts in pregnant women, babies, and children – as well as other adults.

DID YOU KNOW?

- Children's lungs are still developing.
- Children breathe faster and spend more time outside than adults.
- Other organs like their brains and reproductive systems are also still developing.
- That makes children particularly vulnerable to air pollution.
- Pregnant women also need clean air.
- If the air you breathe is polluted, that can lead to health problems for your baby.
- Companies are not required to monitor or disclose dangerous air pollution, and government air monitors may not be sited close to natural gas activity.
- As a result, it's hard to find out whether you are breathing these pollutants in your community.

WHAT IS HAPPENING TO BABIES IN OIL AND GAS REGIONS?

Preliminary studies have found that living near pollution emitted from oil and gas operations may be harmful to your baby's health.

HOW CAN I PROTECT MY BABY?

Because the oil and gas industry does not monitor or disclose air pollution, you should document your family's health by writing down your observations. If you notice health problems, contact your local health department and your state environmental agency. Visit your doctor regularly, and discuss these issues with her.

AIR POLLUTANT	OIL AND GAS SOURCE	HEALTH IMPACTS
BENZENE	Occurs naturally in oil and gas; leaks during routine operations of natural gas wells, pipelines, compressor stations; also released by diesel-powered equipment.	Leukemia, asthma, lung infections, low birth weight, headaches, vomiting, dizziness.
DIESEL EMISSIONS	Emitted from generators and trucks associated with oil and gas development. Pumps and compressor stations are often powered by diesel engines.	Asthma, cancer, lung infections, heart disease, premature death.
FORMALDEHYDE	Emitted by compressor stations; created in the atmosphere when oil and gas pollutants, such as benzene, combine with heat and sunlight.	Asthma, cancer.
METHANE	The main component of natural gas. Leaks at every point along the natural gas life cycle. Sometimes is vented deliberately into the air.	A powerful greenhouse gas that contributes to climate change. Health impacts of climate change include heat illness, asthma, vector-borne infection, and disruptions to the global food supply.
PARTICLE POLLUTION	Emitted from generators and trucks used in oil and gas development. Pumps and compressor stations are often powered by diesel engines. Also caused by heavy truck traffic.	Infant death, asthma, low birth weight, heart attacks, stroke, cancer, premature death.
SILICA DUST	Sand is used in the process of hydraulic fracturing, or fracking. As sand is transported to well pads and poured into well shafts, silica dust can get into the air.	Cancer, silicosis.
SMOG (GROUND LEVEL OZONE)	Created when oil and gas pollutants, such as benzene, combine with heat and sunlight in the air.	Asthma, lung infections, impaired lung development.
